Re-imagine the station network for digital rail

The rail system is a network of train stations where the journey starts and ends. As mobility needs increase, the population is taking more train services. As a result, more passengers will flow through train stations. Sometimes, train stations even become a popular rendezvous point for citizens to meet, dine and socialize, increasing station usage. To support the traffic growth, train stations need to transform to serve the ever-growing needs of passenger and station operations.
